

Use for GMM

The following import statement is required to avoid a warning when we use the GMM. There is a memory leak when we use GMM. Do not use it for other entropy approximations because it slows down the campaign in general.

Note: it causes a problem with the plots. They are created twice.

```
In [1]: #import os
#os.environ["OMP_NUM_THREADS"] = '1'
```

```
In [2]: import MyPlotting as MyPlots
import matplotlib.pyplot as plt
from datastruct import Settings, Experiment, ExperimentStep, DataPoint
from entropy import calc_entropy, default_entropy_options
import numpy as np

from functions_gain_factor import recalculating_entropy
```

9 Reloading Experiments

```
In [3]: # #Reloading Data
exp_control = Experiment.load('8/test1_control_id8c.gz', recalc_yprofs=True)
exp_entropy1 = Experiment.load('8/test1_entropy_id8e1.gz', recalc_yprofs=True)
exp_entropy2 = Experiment.load('8/test1_entropy_id8e2.gz', recalc_yprofs=True)
exp_on_the_fly1 = Experiment.load('8/test1_on_the_fly1_id8o1.gz', recalc_yprofs=True)
exp_on_the_fly2 = Experiment.load('8/test1_on_the_fly2_id8o2.gz', recalc_yprofs=True)

#####
#####Use only when you have a GMM version of
####GMM case
# exp_control_gmm = Experiment.Load('1/test1_control_id1c_gmm.gz', recalc_yprofs=True)
# exp_entropy1_gmm = Experiment.Load('1/test1_entropy_id1e1_gmm.gz', recalc_yprofs=True)
# exp_entropy2_gmm = Experiment.Load('1/test1_entropy_id1e2_gmm.gz', recalc_yprofs=True)
# exp_on_the_fly1_gmm = Experiment.Load('1/test1_on_the_fly1_id1o1_gmm.gz', recalc_yprofs=True)
# exp_on_the_fly2_gmm = Experiment.Load('1/test1_on_the_fly2_id1o2_gmm.gz', recalc_yprofs=True)

#reloaded_exp.creation_time.isoformat()
```

```
In [ ]:
```

```
In [4]: #Notice now all the outcomes have the same size except for the datax, datay and datady
#Last unfitted point

If you meant to do this, you must specify 'dtype=object' when creating the ndarray.
    return np.array(all_yprof)
C:\Users\rober\FINAL NIST PROJECT\datastruct.py:353: VisibleDeprecationWarning: Creating an ndarray from ragged nested sequences (which is a list-or-tuple of lists-or-tuples-or ndarrays with different lengths or shapes) is deprecated. If you meant to do this, you must specify 'dtype=object' when creating the ndarray.
    return np.array(all_pts)
```

Out[4]: 30

Warning

Remember that the maximum time spend in the control data is way greater than for the autonomous cases. Thus, when we are plotting the y-profiles and the histogram for the parameters we should may be truncated the values of control until a time that is closer to max amount of time spend in the autonomous cases.

10 Compare to Benchmark

```
In [5]: # from matplotlib.colors import LogNorm
# from numpy.matlib import repmat

print(exp_entropy1.settings.ground_truth_pars) #{'I0': 30.0, 'A': 15.0, 'phi0': 155.0,
print(exp_on_the_fly1.settings.ground_truth_pars)

{'I0': 30.0, 'A': 27.0, 'phi0': 155.0, 'T': 401.0, 'sigma': 797.0}
{'I0': 30.0, 'A': 27.0, 'phi0': 155.0, 'T': 401.0, 'sigma': 797.0}
```

10.1 Y-Profiles Histograms

```
##Plotting the last set of Y-profiles for the different approaches
##If you do not want to plot the figure of merits do not provide them. It still works

#Entropy 1

# MyPlots.plot_y_profiles(exp_control_gmm.load_yprofs()[-1],exp_control_gmm.settings.x)
# this_title = "Histogram of Y profiles My Control Evenly GMM"
```

10.2 Histogram for the Parameters Samples

Getting the Lists for the Parameters The containers total_pts (and similars) stores 2-D arrays on them; each 2-d array represents an iteration. The 2-d array contain the samples for all the parameters n_samplesn_parameters (*where the number of samples can change per iteration, but the number of columns is constant*). First,based on the columns of each array (each column represents a parameter) we will create lists that represent each parameter where each sub-list inside the list for a given paremeter represents the samples at an iterations, n_iterationsn_samples

Note: 1) Any of the 2-d arays in this_total_pts and this_total_pts2 have as columns representing each parameter. The columns represent respectvily A, I0, T, and phi0. They are in the same order than in the console output from the loop.

2) We Cannot create 2D arrays for each parameter because the number of samples per iteration can change. Thus, we create lists for each parameter.

plottinh_hist() Here we create an auxiliary funtion to plot each of the sublists (that represent the samples at all the iterations for a given parameter) of the output of using the function above.

WARNING: Remember that the number of samples per iteration can change. Thus, a histogram may not be the best way to visualize converge. we have two options.

1. Normalize the number of samples for al iterations.
2. commnet out the line of code mark_outliers() in the main loop. So, we do not rule outliers and then we will have the same number of samples for all iterations.

plottinh_hist()

In [8]: *#getting the Lists for both approaches. The lists contains lists where each sublists is sublists that represent a parameter there are sublists that represent the samples for #at an iteration.*

```
#Entropy Method
list_par_separated_e1 = MyPlots.getting_list_each_par(exp_entropy1.load_pts()) #This line

Helper Functions for Estimator of PDF and Log-likelihoods

These function will be used in the remaining sections

.....

estimator_avg_at

Note: In my opinion, the estimator_avg_at causes an error in some cases bc at some points of the iteration the values are concentrate around the ground truth. Thus, there are no many points to take on the left or right of the interval. So the checking below alert us!

```
if (left_value_index < 0) or (right_value_index > (NUMBER_SAMPLES - 1)): Alert!
```

"" Note: Notice compute_likelohs assumes independence of the parameters (columns). It is using David's estimator for pdf. Ask But can we assume that?

""" Notes likelihood_helper_kde:

1. Using KDE to estimate the pdf. Notice that KDE is a non-parametric estimator. However, it assumes independent samples; this could be a problem. Remember each sample is measurement point in the main loop is chosen based in the previous results.
2. Ask about the bandwidth for this function. In the next functions, we use a kde in a single feature (a parameter or a y at a given measurement place); so we can use the std as the bandwidth. We use the std bc all the other methods s.a. silverman or scott gave us terrible estimators. Thus, it may be the case that they are terrible estimators since we are using silverman. In this case, I am using "silverman". Since it is a multidimesonal pdf I cannot use just the std. Should I tried to use something similar to the std?
""" #likelihood_helper_kde

10.4 Estimator of Log Likelihoods for the Y's

We will use David's estimator and a multidimensional Kde

Using David's Estimator

In [23]:

```
#all_total_Likelihoods
#At each iteration, we have a y-profiles. We compute the likelihood at each x and add
Sum_likelihoods_at_each_iter_entropy1_for_ys = MyPlots.compute_likelihoods(exp_entropy1,
                                                               exp_entropy2)
Sum_likelihoods_at_each_iter_entropy2_for_ys = MyPlots.compute_likelihoods(exp_entropy1,
                                                               exp_entropy2)
Sum_likelihoods_at_each_iter_on_the_fly1_for_ys = MyPlots.compute_likelihoods(exp_on_the_fly1,
                                                               exp_on_the_fly2)

8.5 Estimator of log-likelihood for the Parameters

The log likelihoods estimator will be computed with two fitting: The log likelihoods are computed for the ground truth values.

We compute the log likelihoods in two ways:

-David's estimator for pdf: by default this estimator calculates the pdf for each parameter separately. It is equivalent to the second fitting in Kde

-Kde estimator for pdf: For the kde we use two approaches. The first fitting will use all the samples for all the parameters at a given iteration

The second fitting will use only the data for one parameter to estimate a pdf of each parameter at a given iteration

David's Estimator for Parameters

```
In [29]: #all_total_Likelihoods
